Database management systems will continue to manage large data volumes. Thus, efficient algorithms for accessing and manipulating large sets and sequences will be required to provide acceptable performance. The advent of object-oriented and extensible database systems will not solve this problem. On the contrary, modern data models exacerbate the problem: In order to manipulate large sets of complex objects as efficiently as today's database systems manipulate simple records, query-processi ...

A new text compression scheme is presented in this article. The main purpose of this scheme is to speed up string matching by searching the compressed file directly. The scheme requires no modification of the string-matching algorithm, which is used as a black box; any string-matching procedure can be used. Instead, the pattern is modified; only the outcome of the matching of the modified pattern against the compressed file is decompressed. Since the compressed file is small ...

The knowledge of a short substring constitutes a good basis for guessing the next character in a natural language text. This observation, i.e. repeated guessing and encoding of subsequent characters, is very fundamental for the predictive text compression. The paper describes a family of such compression methods, using a hash table for searching the prediction information. The experiments show that the methods produce good compression gains and, moreover, are very fast. The one-pass version ...

# 1 [Energy Optimization of Distributed Embedded Processors by Combined Data Compression and Functional Partitioning](#)

Jinfeng Liu, Pai H. Chou

 November 2003 **Proceedings of the 2003 IEEE/ACM international conference on Computer-aided design**

 Full text available: pdf(271.86 KB) Additional Information: [full citation](#), [abstract](#)

Transmitting compressed data can reduce inter-processor communication traffic and create new opportunities for DVS (dynamic voltage scaling) in distributed embedded systems. However, data compression alone may not be effective unless coordinated with functional partitioning. This paper presents a dynamic programming technique that combines compression and functional partitioning to minimize energy on multiple voltage-scalable processors running pipelined data-regular applications under performance constraints.

Code compression has been shown to be an effective technique to reduce code size in memory constrained embedded systems. It has also been used as a way to increase cache hit ratio, thus reducing power consumption and improving performance. This paper proposes an approach to mix static/dynamic instruction profiling in dictionary construction, so as to best exploit trade-offs in compression ratio/performance. Compressed instructions are stored as variable-size indices into fixed-size codewords, etc.

In this paper we present DataIndexes, a family of design strategies for data warehouses to support OnLine Analytical Processing (OLAP). As the name implies, DataIndexes are both a storage structure for the warehoused relational data and an indexing scheme to provide fast access to that data. We present two simple DataIndexes: the Basic DataIndex (BDI), which can be used for any attribute and the Join DataIndex (JDI), which is used for foreign-key attributes. Either structure can be shown to sign ...

## Order preserving string compression

Antoshenkov, G. Lomet, D. Murray, J.

### Abstract:

Order-preserving **compression** can improve sorting and **searching** performance hence the performance of database systems. We describe a new parsing (tokenization) technique that can be applied to variable-length "keys", producing substantial **compression**. It can both **compress** and **decompress** data, permitting variations for dictionary entries and **compressed** forms. The **key** notion is to partition strings into ranges, encoding the common prefix of each range. We illustrate with padding character **compression** for multi-field keys, demonstrating the gains possible. A specific version of the method has been implemented in Digital relational database system to enable effective multi-field **compression**.

Sophisticated imaging and fetal sampling techniques have defined the natural history and pathophysiologic characteristics of many previously mysterious conditions of newborn. Although most prenatally diagnosed malformations are best managed by appropriate medical and surgical therapy after delivery, an increasing number of simple anatomic abnormalities with predictably devastating developmental consequences have been successfully corrected before birth. Many of the technical intricacies of open fetal surgery have been solved, but preterm labor remains an omnipresent risk to the mother and fetus. The recent development of minimally invasive techniques to treat the fetus prenatally has significantly lessened preterm labor. Minimally invasive surgical techniques, in combination with new tocolytic strategies, promise to extend the indications for fetal surgical intervention.
